

Aged Care Pain Management Flowchart NSQHS Standard 4 & 5 & ACQS Standard 2 and 3

WHAT: Identify residents with pain
e.g. medical history, pain medication, history of use of other non-pharmacological interventions, immobility, reduced function, pressure injury etc.

WHEN to complete pain assessment:

- On admission
- In the event of a significant change in a resident's condition
- any time pain is suspected
- at least every three months

Comments

Individual resident wishes and goals must be established through inclusion of the resident and their carer/representative in all aspects of the pain management process.

How:

- Complete **RC5** on admission followed with **RC9** (Pain assessment/ Abbey Pain Scale if pain is identified)
- Complete **RC10/ Abbey Pain Scale** when there is an **increase in already identified pain**
- For non-verbal residents who may have hearing and speech impairment or cognitive impairment, use other alternative communication methods, e.g. picture cards
- Notify treating doctor when there is new or increase in pain

Monitor

- Evaluate pain management strategies using **RC10**
- Store in front of medication file when evaluating pain.

Care Plan

- Document pain management strategies in the care plan.
- Review pain management strategies every three months, on regular use of PRN analgesia/ other interventions and on change of patient's condition.
- Consult with resident, family, doctor and other relevant health professionals about strategies

Note

- For consistency in identifying and managing pain same assessment tools must be used for the individual resident.
- Abbey pain scale with descriptors is a better tool in determining level of pain as opposed to just the faces.

Referrals

- Refer to PT and/or OT for comfort support and exercises
- Refer to a pain specialist after reasonable trials of pharmacological and non-pharmacological therapies
